

# **Co@Pro- Connecting Professionals**

## **ABSTRACT**

In today's generation professional employees aim to build their career to greater heights, though being employed they would like to explore the growing advancements in technology and be a part of it.

Co@Pro is such platform which connects the professionals and lets them showcase their skills. This platform enables the employees to take part various technical events and learn by notifying them based upon their interests. These technical events range from seminars to hackathons conducted by IT companies. The employees of a company can register using a unique code that is given to the company HR or point of contact during their registration (Company registration). The platform has two interfaces HR and employee, where the HR or the point of contact organizes events and is given privilege to perform some activities such as providing certificates based on the company's interest to the registered employees for the respective event. And an employee can browse various events and register for them as well. An employee receives mails regarding the events based on his/her interests and he/she can register to the events through the platform and receive certificates after the event is completed.

REST-API – Hibernate ORM is used to integrate with Angular framework and MySQL Database. SMTP server is used for mailing activities and Twilio API for SMS.
